

TuniTech Abroad

Business Requirements Document (BRD)

Version: v1 | Status: Review Draft | Date: 12 June 2026

1. Executive Summary

TuniTech Abroad is a France-first job intelligence platform for Tunisian IT candidates, students, bootcamp graduates, and internship seekers. The product aggregates France IT jobs, helps users upload and complete their CV/profile, recommends realistic jobs or internships, detects missing skills, and provides practical CV/job-fit guidance before applying.

The product is not a generic job board. Its core value is candidate intelligence: helping Tunisian IT profiles understand which France opportunities are realistic, why they match, what is missing, and what to improve.

2. Product Identity

Product name	TuniTech Abroad
Document	Business Requirements Document
Version	v1
Status	Review Draft
Candidate market	Tunisia
First destination market	France
Domain	IT jobs and internships
Primary UI language	French

3. Business Problem

Tunisian IT candidates who target France or other francophone markets face a fragmented and inefficient job search process.

- France IT jobs and internships are scattered across multiple platforms.
- Candidates apply randomly without knowing if their CV actually fits the job.
- Candidates do not know which technical skills are missing.
- Students and junior candidates struggle to identify realistic internships, PFE opportunities, and first jobs.
- Mid-level candidates may have relevant experience but weak CV positioning.
- Generic job boards list jobs but do not explain fit, missing skills, or readiness.
- Generic CV checkers analyze CVs without connecting them to real France IT job demand.

The market gap is job intelligence, not job listing volume.

4. Product Vision

Build the reference platform for Tunisian IT profiles targeting francophone international opportunities, starting with France and later expanding to Belgium, Luxembourg, Canada, and Switzerland.

The MVP focuses on France only to keep data sourcing, matching logic, and product scope controllable.

5. Core Positioning

Positioning statement: TuniTech Abroad helps Tunisian IT profiles understand which France IT jobs or internships they can realistically target, what they are missing, and how to improve their CV/profile before applying.

Short positioning: France IT job intelligence for Tunisian tech profiles.

6. Target Users

User group	Description	Primary needs
Junior IT candidate	0-2 years experience; may target first job, junior role, summer internship, standard internship, or PFE.	Realistic recommendations, missing skills, CV guidance, junior-friendly filters.
Final-year IT student	Preparing for PFE, summer internship, France internship, or first job after graduation.	Market visibility, skill roadmap, project/CV positioning, internship filtering.
Bootcamp graduate	Candidate entering the IT market through bootcamp training.	Skill gap roadmap, realistic expectations, project-based CV guidance.
Mid-level developer	2-5 years experience targeting France IT jobs.	Better targeting, CV alignment, role/stack positioning, advanced gap detection.

7. Secondary Users and Future Business Opportunities

- Training centers, bootcamps, and universities: future dashboard for student employability, readiness scores, cohort skill gaps, and placement analytics.
- Recruiters and recruitment agencies: future access to pre-analyzed candidate profiles and job-fit signals.

These are not MVP user groups for product functionality. They are later monetization directions.

8. Value Proposition

Audience	Value delivered
Candidates	Know which jobs match, why they match, which skills are missing, and what to improve.
Students/internship seekers	See realistic internship/PFE/first-job options and understand the roadmap from current profile to target jobs.
Bootcamp graduates	Understand skill gaps and improve employability using real France IT job demand.

Mid-level developers	Prioritize stronger applications and improve CV positioning for France recruiters.
Future training centers	Measure student readiness and align training with real demand.

9. MVP Scope

9.1 Included

- Public landing page and public France IT job search.
- Job detail pages from local normalized database.
- France Travail API as primary job source.
- Raw job storage and normalized job storage.
- Job freshness tracking: active, stale, expired, removed, archived.
- Google login, GitHub login, and email/password signup.
- Email verification for email/password users.
- PDF CV upload and parsing.
- Manual profile completion after parsing.
- Anonymous quick-match teaser using manual skills.
- Rule-based match scoring.
- Job recommendations.
- Skill gap detection using canonical skill taxonomy and aliases.
- Controlled OpenRouter LLM usage for extraction help and explanations.
- Saved jobs, match history, email preferences, optional weekly digest.
- Django Admin-based admin dashboard.
- Basic privacy/GDPR features: Privacy Policy, Terms, CV consent, delete CV, delete account.

9.2 Excluded

- Employer dashboard, recruiter dashboard, training center dashboard.
- Payments and subscriptions.
- Belgium, Luxembourg, Canada, and Switzerland jobs.
- Welcome to the Jungle partnership/API integration, APEC scraping, Adzuna fallback.
- LinkedIn full profile import, LinkedIn login, Facebook login.
- Auto-apply, chatbot, mobile app, salary prediction, company reviews, messaging.
- Legal immigration advice or guaranteed employment/relocation claims.
- AI-only scoring or bulk LLM job ranking.

10. Job Source Strategy

MVP primary source: France Travail API Offres d'emploi. The platform should ingest jobs on a schedule, store raw source records, normalize jobs locally, and serve search/recommendations from PostgreSQL rather than calling the external API for each user search.

Future internship/alternance source: La Bonne Alternance API, especially for apprenticeship/alternance opportunities. It is not required in the first MVP build unless France Travail internship coverage is insufficient.

- No scraping for MVP.
- No live external API call per user search.
- High-intent revalidation may refresh a specific job when a user opens or applies to an old job.

11. Skill Taxonomy Strategy

MVP uses a flat canonical skill taxonomy with aliases. This prevents noisy matching between raw strings such as Python, Python 3, python developer, and Python/Django.

Entity	Purpose
Skill	Canonical normalized skill such as Python, Django, Docker, PostgreSQL.
SkillAlias	Aliases that map raw extracted strings to a canonical skill.
UnknownSkillCandidate	Unmatched extracted skill stored for admin review.

- MVP target: 200-300 canonical IT skills.
- Aliases target: 500-1000 aliases.
- Initial categories: Programming Language, Frontend, Backend, Database, DevOps, Cloud, Testing, Data/AI, Mobile, Tools, Methodology, Soft Skill.
- LLM may suggest skills, but the system maps them to canonical taxonomy before scoring.

12. Matching and Recommendation Strategy

The product separates candidate-job fit from recommendation ranking.

Fit score component	Weight
Technical skills match	45%
Experience level match	20%
Role/title match	15%
Language fit	10%
Location/remote/relocation fit	10%

Recency affects recommendation ranking, not fit score. Recommendation ranking combines fit score, freshness boost, target-type boost, user-preference boost, and stale-job penalty.

13. Anonymous Quick-Match Teaser

To reduce funnel friction, anonymous users may test a limited match on a job by entering 3-5 skills, experience level, and French level. The teaser returns an estimated match, matched skills, likely missing skills, and a prompt to create an account for full CV analysis.

The anonymous teaser does not use LLM, does not store a CV, does not create recommendations, and does not save history.

14. Authentication and Profile Strategy

Method	MVP decision
Google login	Included.
GitHub login	Included.
Email/password	Included with email verification.
LinkedIn login	Excluded from MVP.
Facebook login	Excluded from MVP.
LinkedIn profile import	Excluded from MVP due to restricted API access. Manual LinkedIn URL is included.

OAuth simplifies account creation but does not replace profile completion. Users must still complete phone, location, LinkedIn/GitHub/portfolio URLs, target role, target type, experience, language levels, and preferences.

15. Privacy and Compliance Basics

The product processes CVs and recruitment-related personal data. MVP must include concrete privacy features, not only internal security notes.

- Privacy Policy page.
- Terms page.
- Explicit CV upload consent checkbox.
- Delete CV action.
- Delete account and associated data action.
- Email unsubscribe/preferences.
- No public CV exposure.
- Restricted admin access to user CV/profile data.
- No guaranteed employment, visa, or relocation claims.

16. Business Model

Phase	Monetization logic
Phase 1: Free MVP	Validate demand with free job search, limited CV matching, recommendations, and saved jobs.
Phase 2: Candidate monetization	Paid detailed CV/job-fit report, CV rewrite for France market, personalized roadmap, premium explanations.
Phase 3: B2B monetization	Training center dashboard, bootcamp/university employability analytics, recruiter/talent pool access.

17. Success Metrics

Category	Metrics
Product	Registered users, uploaded CVs, completed profiles, job searches, job detail views, saved jobs, returning users.
Matching	Match analyses generated, recommendation click-through rate, saved jobs from recommendations, user feedback on match quality.
Data quality	CV parsing success rate, job normalization success rate,

	skill extraction success rate, unknown skill rate.
Cost/control	LLM calls per user, cache hit rate, LLM cost per active user.
Business validation	Users requesting CV improvement, paid report interest clicks, digest opt-ins, organic traffic growth.

18. Main Risks and Mitigations

Risk	Mitigation
Job source limitations	Start with France Travail API, store raw payloads, track source errors, add La Bonne Alternance later if needed.
Skill matching noise	Use canonical skill taxonomy with aliases and admin review for unknown skills.
CV parsing errors	Show extracted profile to user and require manual confirmation/completion.
LLM cost growth	Rule-based scoring, caching, rate limits, LLM only for selected explanations/extraction support.
Funnel friction	Anonymous quick-match teaser before signup.
Privacy risk	Consent, deletion, restricted CV access, clear policy pages.
Scope creep	France-only MVP, no recruiter/employer/training-center side yet.

19. Recommended Technology Direction

- Backend/product: Django.
- Frontend: Django templates + HTMX + Tailwind.
- Database: PostgreSQL.
- Background jobs: Redis + Celery or RQ.
- Auth: django-allauth for Google, GitHub, email/password.
- AI: OpenRouter, controlled and cached.
- Admin: Django Admin for MVP.

20. Final MVP Decision

Build a France-first job intelligence platform for Tunisian IT candidates, students, bootcamp graduates, and internship seekers. The core loop is: user finds France IT jobs or internships, uploads CV or tests quick match, completes profile, receives recommendations, sees match score, understands missing skills, saves or applies to better-targeted opportunities.

This BRD is ready for review before moving to Technical Architecture v1 after PRD validation.
